

I support the ARRL on the matter before the FCC on implementing Broadband over powerlines (BPL)

The electric companies have a hard time complying with current FCC rules for spurious emissions from their equipment, adding BPL to the mix will only further cause more noise and interference.

Yes, broadband is important to the communications infrastructure, but BPL is not a technology that should be pursued in it's current form.

Interference will result and those results will be devastating not only to amateur radio, but also to other communications services which depend on HF operation.

I strongly urge the commission NOT TO approve widespread BPL adaptation.

Thank you for hearing my comments.
